Engelsiz Çeviri Analysis and SignBridge-TR Differentiation

SB-21 | v1.2 | 26 October 2026 | Research report for team review

Executive finding and positioning

SignBridge-TR should be positioned as a user-operated, constrained conversation research prototype, rather than a replacement for an institutional content-access suite. Engelsiz Çeviri markets website integration and demo-led institutional solutions; however, its announced two-way product also targets face-to-face service encounters. The distinction is deployment emphasis and research scope, not an exclusive user group, use case or capability [1,5,6,8,10].

1. Aim, method and evidence levels

This SB-21 report documents users, directions, channels, avatar choices and limitations; compares both systems; proposes four justified contributions; and supplies a Statement of Work (SoW) Literature Review paragraph [13]. Sources were checked on 26 October 2026. The baseline is proposal v1.1 revision 6 (R6) and its technical notes. A gloss is a written sign label, not the sign itself [8,9].

Documented: a provider/project statement. **Observed:** a visible interface or supplied promotional frame. **Not established:** insufficient reviewed evidence, not proof of absence. Five official product pages, homepage, security policy and project sources were read. Earlier supplied screenshots/video samples are supplementary observations only; no conclusion depends on their private filenames. No vendor trial, accuracy test, linguistic validation or comparative network audit was conducted.

2. Provider evidence by product

Product / users	Documented direction and channel	Evidence boundary
Web [1]	Website text to signs for Deaf/hard-of-hearing readers; JavaScript integration; movable window and speed control.	Avatar or human-model choice; production method and intelligibility protocol not established.
Video [2]	Subtitles to synchronised signs within an integrated video player; movable/resizable presenter.	Subtitle-based; audio transcription and measured synchronisation not established.
PDF [3]	Selected PDF sentences to signs; institutional documents and sector terminology.	Avatar/human-model options; scanned-PDF OCR and unseen-document accuracy not established.
Printed material [4]	QR-linked text to signing; narration for visually impaired users.	Blind-user support is documented here; complete nonvisual conversation is not established.
Two-way [5]	Signs ↔ text/speech; ordinary camera; browser delivery; labelled under development.	Bank, hospital and university examples overlap with SignBridge-TR. Advertised independence is not a tested outcome.

The homepage displays organisation logos and requests company information for demos. These support an institutional-sales interpretation, not verified contracts, prices or deployment success [6]. A human-looking signing presenter is not evidence of a live interpreter.

3. Comparison: claims, plans and limits

Dimension	Engelsiz Çeviri	SignBridge-TR
Product emphasis	Institutional content integration plus announced two-way communication [1,5,6].	User-operated browser/PWA conversations on personal or shared devices; proposed, not validated deployment [8,10].
Scope and overlap	Multiple content channels; service conversations also advertised [1]-[5].	Short service/daily conversations. Hospital and university scenarios overlap; neither domain is unique [8,10].
Recognition	Ordinary-camera input stated; supported recognition classes and unseen-signer protocol not established [5].	Isolated signs separated by pauses; dataset coverage audit required. Unrestricted continuous signing excluded [8,9].
Vocabulary scale	Homepage image alternative text claims over 10,000 sign-language words; direction, counting unit and validation unspecified [6].	≥300 output signs plus fingerspelling is a target; AUTSL recognition classes form a separate vocabulary [8,9].
Language / avatar	Avatar/human-model choice documented; internal translation/motion pipeline not established [1,3].	Planned language model + TİD rule layer, lexicon and prepared clips; no completed library claimed [8,9].
Accessibility	Printed-material narration documented [4].	General accessibility in scope. Independent blind-specific interaction awaits team/advisor scope decision; mediated example uses the partner’s device [8,10].
Data / connectivity	General security policy published; browser and internet-independent claims coexist without deployment detail [5,7].	Raw camera video stays on device in proposed design; other transfers depend on service choices. Full offline use is not promised [8,9].
Evaluation / readiness	Promotional percentages lack a reproducible protocol in reviewed pages; two-way system under development [1,2,5].	Research targets remain targets. Two-clip offline MediaPipe study supports limited extraction feasibility, not recognition or mobile/browser success [8,12].

4. Four justified differences or strengthened contributions

D1 - User-operated conversation workflow. Emphasise launching a session, ending sign input, checking/editing the sentence before speech and reusing quick phrases. This is a concrete product focus compared with website-content integration, but not unique against the vendor’s two-way offering. Evidence to produce: agreed scenarios and a working end-to-end demonstration [8,10].

D2 - Reproducible recognition. Record dataset version, class/gloss mapping, preprocessing, signer-independent splits, baselines and held-out results; separate live and offline measurements. This strengthens research transparency rather than claiming superior accuracy. Existing objectives: ≥85% top-1, ≥95% top-5 and ≥15 fps laptop landmark processing; not achieved results [8,9,12].

D3 - Auditable language-to-animation decisions. Link Turkish inputs, gloss/rule decisions and permitted clips; evaluate the rule layer against a fixed language-model-only baseline. Separate clip-reference conformance from Deaf-user comprehension. Avatar presence alone is shared functionality; traceable decisions are the proposed research contribution [8,9].

D4 - Measured conversation and explicit data boundaries. Report event-defined latency, confirmation time, task completion and usability by stage/group, alongside actual service transfers. The ≤2.0 s sign-to-speech and ≤2.5 s speech-to-avatar medians remain proposal targets. This is not evidence that the vendor lacks evaluation or has weaker privacy [8,9].

5. Limitations, privacy and scope consistency

Scale is a limitation, not an advantage. The provider's over-10,000-word marketing claim suggests a much broader advertised lexicon than the prototype's ≥300-sign output target. These are not equivalent verified counts: neither the provider's count nor completion of the prototype library was established. Do not equate either figure with recognition classes or sentence competence [6,8].

Connectivity needs clarification. The two-way page states internet-independent availability and browser operation. A web application can support offline processing, so this is not inherently contradictory. Which stages work offline, model downloads, provider requests, caching and data retention are not explained in the reviewed source. Neither offline completeness nor cloud dependence is established [5].

Security policy inspected. The one-page policy dated 15 January 2024 commits to protecting information assets, risk management, standards alignment and improvement; it does not specify product audio/video routes, processors, storage locations or retention. The homepage displays an ISO/IEC 27001 badge, but no certificate scope or validity was verified. Its footer's Privacy Policy and Terms of Use labels were plain text without linked documents in the retrieved HTML. Their text could not be reviewed; this does not establish that no such policies exist [6,7].

Accessibility correction. The submitted proposal's broad "Blind-user support: Not described" comparator entry should be narrowed at the next agreed revision: "Printed-material narration is documented; complete nonvisual two-way interaction was not established." This corrects the comparison, not the project scope. Blind-specific independent features remain an open team/advisor decision (D-23); the primary happy path is mediated, and its independent variant is proposed [4,8,10].

No superiority or participant shortcut. Vendor methods and common test inputs are unavailable. Simulated pre-tests cannot establish target-user usability; reference checks cannot replace Deaf-user comprehension. Necessary approvals and consent still apply. Third-party promotional files are not republished or required evidence: public URLs and an observation log are sufficient for these claims; archive copies only where use/redistribution rights permit [8,9].

6. SoW Literature Review paragraph

Engelsiz Çeviri offers institutional TİD content-access integrations and announces a two-way service-communication tool under development [1]-[5]. Its bank, hospital and university settings overlap with SignBridge-TR, so bidirectionality, browser access and avatar output are not unique contributions [5]. SignBridge-TR instead proposes a user-operated conversation prototype within a limited vocabulary, with confirmation/editing before speech, reproducible signer-independent recognition, traceable gloss-to-clip decisions and separate conversation/data-flow evaluation [8,9]. Printed-material narration already addresses visually impaired users; broader nonvisual interaction remains unverified, while SignBridge-TR's independent blind-specific scope is unresolved [4,10]. These are bounded product/research emphases, not demonstrated superiority.

Suggested aim sentence: Develop and evaluate a user-operated TİD–Turkish conversation prototype for constrained service scenarios, with explicit confirmation, traceable language-to-animation decisions and reproducible evaluation.

7. References and project integration note

All online sources below were accessed on 26 October 2026. Project document URLs are pinned to the inspected main snapshot. Source [11] is a separately reviewed PR snapshot; it is not treated as merged into main.

Integration and follow-up (not completed actions)

Use Section 6 in SoW Section 2 alongside the existing Literature Review; coordinate scope/acceptance wording with SB-24. PR #26 corrects vocabulary name-match statements and the hospital example; coverage and linguistic validation remain pending [10,11,14]. Suggested follow-up: the proposal/SoW owner should track the accessibility comparator correction with the wording in Section 5 and have it reviewed before the next approved revision. No follow-up issue or advisor message was created by this report.
